	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** • Gameboard with alternating turns for players • Scrabble word legality checker for entered input (use API) • Keeping track of letter points and overall score to determine winner	**Schedule - (For V2.0+)** • Double/triple word points (similar to real scrabble) • Longer mode than just typical Scrabble, with its preset number of letters • Choice of dictionary ? OSPD vs. SOWPODS
Not Important	**Delegate - (Use a library)** • Not sure if the scrabble word legality API should go here too, since it's fairly important to the game, but I'm definitely not making it myself • Any kind of randomizer for the letters. Aside from keeping track of the score and how many letters have been used, I can just use an existing randomizer to generate new letters • Any kind of timer for turns if it's decided to implement time limits	**Delete - (Cut it)** • clicking to determine where to place words. Just use a clearly-marked grid along with the board and let user give coords • Multiple languages/ alphabets • Multiple-device version of the game
